

QUALITY REPORT FOR STATISTICAL SURVEY
Monthly Report on Construction (GRAD-21/M)
For 2021.

Organisational unit: Construction Statistics Department

Prepared by: Srećko Palej

May 2024

0. Basic information

- Purpose, goal, and subject of the survey

Monthly Report on Construction provides data on the following:

- 1) works done on constructions in the Republic of Croatia, by types of constructions and works. The presentation of the volume and dynamics of construction works done during the year is done through the volume index of construction works, which is based on hours worked on construction sites in the Republic of Croatia.

Volume indices of construction works are compiled on a monthly basis for construction total, for buildings and civil engineering works.

As short-term indicators, volume indices of construction works are used rather to determine the dynamics and structural changes in construction works over time than their level.

- 2) value of new orders, which are used to predict future works.

Observation units are business entities (legal entities and crafts) classified in the Statistical Business Register under section F Construction (divisions 41, 42, 43) and legal entities that are not classified under Construction activity in the NKD 2007, but contain parts (working units, plants and parts of legal entities) that perform construction works (e.g. HEP, public utility companies, etc.).

- Reference period

Month

- Legal acts and other agreements

The legal bases for the Monthly Report on Construction (GRAD-21/M form) are the following:

- Official Statistics Act (NN, No 25/20)
- Programme of Statistical Activities of the Republic of Croatia
- Annual Implementation Plan of Statistical Activities of the Republic of Croatia
- Council Regulation (EC) No 1165/98 of 19 May 1998 concerning short-term statistics
- Regulation (EC) No 1158/2005 of the European Parliament and of the Council of 6 July 2005 amending Council Regulation (EC) No 1165/98 of 19 May 1998 concerning short-term statistics
- Commission Regulation (EC) No 1503/2006 of 28 September 2006 implementing and amending Council Regulation (EC) No 1165/98 concerning short-term statistics as regards definitions of variables, list of variables and frequency of data compilation
- Regulation (EU) 2019/2152 of the European Parliament and of the Council of 27 November 2019 on European business statistics, repealing ten legal acts in the field of business statistics
- Commission implementing Regulation (EU) 2020/1197 of 30 July 2020 laying down technical specifications and arrangements pursuant to Regulation (EU) 2019/2152 of the European Parliament and of the Council on European business statistics repealing ten legal acts in the field of business statistics
- Regulation (EC) No 1893/2006 of the European Parliament and of the Council of 20 December 2006 establishing the statistical classification of economic activities NACE Revision 2 and

amending Council Regulation (EEC) No 3037/90 as well as certain EC Regulations on specific statistical domains

The obligation of reporting units to submit data is based on Article 45 of the Official Statistics Act (NN, No 25/20).

Refusing to provide data, providing incomplete and inaccurate data, or failing to provide data within the prescribed deadline will be subject to the misdemeanour provisions laid down in Article 76 of the aforementioned Act.

- Classification system

National Classification of Activities, 2007 version

National Classification of Types of Constructions

- Statistical concepts and definitions

Observed variables in the Monthly Report on Construction are the following:

1) hours of work done by workers on sites in the reporting month by types of constructions (at the level of two-digit numerical code of the National Classification of Types of Constructions – NKVG) and types of works. The hours of work actually done by workers directly on construction sites are included, as follows:

- hours worked according to collective and other contracts as well as written and verbal agreements
- hours worked in overtime, night-time work, work done on Sunday and national holidays
- hours worked by workers hired by agencies or borrowed employees of other units or business entities
- hours worked by owners of (smaller) business entities and members of their families if they directly participated in works on construction sites
- hours worked by pupils during their traineeship.

Hours worked also include short interruptions during work-time, but do not include longer breaks such as those that occurred e.g. due to lack of building material, loss of electricity, construction machines breaking down, etc.

These hours actually worked are included regardless of whether they were paid for or not or if they are not going to be paid for or not.

Paid working hours for non-working periods (e.g., hours of workers on a grace period, vacation, sick leave, strike, etc.) and hours of managerial and clerical personnel connected with construction activity are not included.

Based on hours actually worked, the volume index of construction works is compiled. According to the Eurostat guidelines, working hours on construction sites are a good alternative for calculating the volume of construction works and measuring construction production in monthly dynamics. The main reason for this is that the working hours on construction sites are closely related to the production process in the reporting period and are available on a monthly basis.

Until 2015, volume indices of construction works were compiled on the basis of hours of works done by workers on construction sites, but they were not adjusted for a productivity factor. In order to improve the level of compliance of official statistics in the Republic of Croatia with the recommendations of Eurostat, the adjustment of working hours for the productivity factor was

carried out. The productivity factor is estimated on an annual basis from the deflated value of works and hours worked, separately for buildings, and separately for other civil engineering works. The fluctuation of individual values of the productivity factor is alleviated by using the exponential smoothing of the time series. After the calculation of indices for buildings and for civil engineering works, the next phase includes the calculation of the index for the total construction indirectly by aggregating these two semi-indices by applying the Laspeyres' formula. Weights are defined according to the share of the value added from section F – Construction, considering the production factors' costs from structural business statistics in a base year.

The new method has been applied to monthly indices since January 2000.

Since the productivity factor is estimated on an annual basis on the basis of the data from the previous year, the data for the whole reference year will be issued as provisional data. After the calculation of the actual productivity for the reference year is done, the final results are published.

The volume index of construction works is an important short-term indicator for construction statistics which is used for the analysis of a business cycle and as input for national accounts for the calculation of the gross domestic product (GDP).

- 2) value of orders by types of constructions. The value of orders is the total value of contracts made in a reference month with ordering parties. An order is considered to be made on the day when a contract is signed between the ordering party and the contractor. Orders should also include construction for own needs, i.e. the needs of a business entity that performs construction works and other cases when there is no written contract with the ordering party.

On the basis of data on the value of new orders, the dynamics of construction activities, future works and the structure of investments can be predicted.

- **Statistical units**

Observation units are business entities (legal entities and crafts) classified in the Statistical Business Register under section F Construction (divisions 41, 42, 43) and legal entities that are not classified under Construction activity in the NKD 2007, but contain parts (working units, plants and parts of legal entities) that perform construction works (e.g. HEP, public utility companies, etc.).

- **Statistical population**

Section F – Construction from NKD-a 2007

The survey is based on a cut-off sample, which means that a very detailed survey is conducted for business entities with 20 or more employees. For business entities with less than 20 employees, data are not collected and sampling is not applied.

The target population are all active business entities that are classified in sections 41, 42 and 43 in the Register of Business Entities or the Crafts Register and that employ 20 or more employees.

1. Relevance

1.1. Data users

Users of statistical data from the Monthly Report on Construction can be found in all areas of economic and social life, starting from business entities, the media, economic analysts, researchers and students, to state administration bodies, professional business organisations (Croatian Chamber of Economy), non-profit organisations (Croatian Chamber of Trades and Crafts, Croatian Employers' Association), financial institutions (Croatian National Bank, Raiffeisen bank, etc.) and internal users from the Croatian Bureau of Statistics (national accounts).

1.1.1. User needs

Users of statistical data from the Monthly Report on Construction can be found in all areas of economic and social life, starting from business entities, the media, economic analysts, researchers and students, to state administration bodies, professional business organisations (Croatian Chamber of Economy), non-profit organisations (Croatian Chamber of Trades and Crafts, Croatian Employers' Association), financial institutions (Croatian National Bank, Raiffeisen bank, etc.) and internal users from the Croatian Bureau of Statistics (national accounts), which use data series of volume indices of construction works.

1.1.2. User satisfaction

Not available.

1.2. Completeness

Volume indices of construction works are available at a one-digit level of the NKVG (for buildings, civil engineering works and total) on a monthly basis for national needs as well as for Eurostat. It is in line with Council Regulation (EC) No 1165/98 and Regulation (EU) No 2019/2152.

1.2.1. Data completeness rate

Data completeness rate is 100%.

2. Accuracy and reliability

2.1. Sampling error

It is not possible to determine sampling errors because the sample is not based on random sampling. Given that there is no secondary source of data for the entire population, it is not possible to estimate the accuracy of the change in the occurrence of the selected model. It is only possible to estimate the accuracy of the change in the occurrence on a monthly, quarterly and annual level. The estimate of the non-sampled part of the population (business entities with less than 20 employees) is not carried out due to the specific nature of construction activity (a large number of small business entities that perform all works regardless of the registered activity). Based on the registered activity, it is not possible to determine how much work these business entities did on buildings, nor on civil engineering works.

The reasons why sampling was not applied are the following: a large number of small units that should be included in the sample, a large burden on the reporting units, and high costs of data collection for the Croatian Bureau of Statistics.

2.1.1. Sampling error indicators

The indicator is not applicable.

2.2. Non-sampling error

Non-sampling errors are related to all other errors that are not connected with the sample selection – coverage, measurement, processing, non-response. They are regularly calculated and controlled.

2.2.1. Coverage error

Non-coverage

It occurs mainly due to the incorrectly stated activity of a business entity in the Statistical Business Register – hereafter the SBR (the business entity is classified in an activity other than construction, but actually performs construction works). No record is kept of the number of non-covered reporting units due to the incorrectly stated activity. Given that at the time of forming the contingent of reporting units, there is no possibility of comparing data from the SBR with some other data source (because there is no

other data source), no assessments are made for these units either, because their importance is unknown. Therefore, in this survey, the target population is limited to the one covered by the framework, while the impact of non-covered units is neglected. However, the Croatian Bureau of Statistics makes great efforts to reduce this error, so that expert departments/units regularly send all collected information (on incorrect data on reporting units, e.g. wrong address, engaged in some other activity) to the SBR, which regularly updates the file. That is why there will be fewer and fewer such mistakes in the SBR.

Over-coverage

As in the case of non-coverage, it occurs mainly due to the incorrectly stated activity of a business entity in the SBR (the business entity is classified in a construction activity, but actually performs an activity other than construction). This error is detected during the collection and checking of data and contacting with the reporting units. In 2021, six business entities were included in the coverage, which were actually engaged in an activity other than construction, which is 0.5% of all units included in the coverage. These units were engaged in industrial activity or trade. The obtained information were sent to the Statistical Business Register in order to update the data.

Duplication

The risk/probability for this error is zero, because coverage is formed from the SBR. So far, multiple coverage of reporting units has not been recorded.

2.2.2. Over-coverage rate

Over-coverage rate is 0.5%.

2.2.3. Measurement error

Although there is no other source of data, i.e. databases/registries with which data obtained from the Monthly/Quarterly Report on Construction could be compared and thereby establish measurement errors, the Construction Statistics Department compares movements in the volume index of construction works with the data on movements in the number of persons employed in construction from the Labour Market Statistics Department. However, in this comparison, different data collection methodologies should be taken into consideration. According to the methodology of the Labour Market Statistics Department, persons are employed as long as they have an employment record book in a business entity, regardless of whether they actually work and receive a salary or not, while the volume index of construction works is based on the hours actually worked on the construction site and therefore, in the case of economic difficulties, the total number of persons employed in construction is falling more slowly than the indices of construction production. However, despite the differences in the methodology, when comparing the annual data for working hours (GRAD-21/M and GRAD-21/3M forms) and the total number of persons employed in construction (data from the Labour Market Statistics Department), it can be concluded that there is a strong connection between these two variables.

The correlation coefficient for the period 2001-2021 is 0.85.

In addition, if we compare the annual data on the value of orders (GRAD-21/M and GRAD-21/3M forms) with the estimated value of works from the Monthly Report on Issued Building Permits (GRAD-44a), it can be concluded that there is a significant connection between these two variables.

The correlation coefficient for the period 2001 – 2021 is 0.74.

Errors in measurements while collecting data occur due to lack of knowledge, negligence, lack of appreciation of importance of statistics, not knowing how to respond and conscious/unconscious presenting of inaccurate data by respondents. Problems arising from unclear questions in the questionnaire, measurement units or ambiguous instructions for filling in the forms are minor due to the fact that the availability of data was taken into consideration while defining their content. In addition, the reporting units are welcome to contact Croatian Bureau of Statistics, which provide assistance to the

reporting units in filling in reports and controls the completeness and accuracy of data. These measurement errors do not represent a major issue, since they are revealed during the visual and calculation control of data before they are entered in the computer as well as by the default computerised data editing during data processing. When such illogicalities or errors are detected, the reporting units are contacted for the check-up of inaccurate and incomplete data and for the correction of inaccurate data.

2.2.4. Non-response errors

Unit non-response

The unweighted non-response rate is 1.1%. For other reporting units, all data are available within the given deadlines. If some data are missing or the reporting units are late in delivering the data, those reporting units are contacted by phone and asked to deliver the data.

Item non-response

There were no non-responses for variables. In the data processing phase, the reporting units that have not fully completed the questionnaire are contacted by phone and asked to provide corrected or missing data. The response rate is 100%.

2.2.5. Unit non-response rate

Unweighted non-response rate:

%

Domain	Domain value	Comment	January	February	March	April	May	June	Jul	August	September	October	November	December	Average
Croatia	Croatia		0,2	0,5	0,6	0,9	0,9	0,9	1,4	1,2	1,7	1,2	1,7	1,7	1,1

2.2.6. Item non-response rate

Unweighted non-response rate for certain variables:

%

Variable	Domain	Domain value	Comment	January	February	March	April	May	June	July	August	September	October	November	December	Average
Non-response rate for all variables	Croatia	Croatia		0	0	0	0	0	0	0	0	0	0	0	0	0

2.2.7. Processing errors

The most common processing errors occur due to the incorrectly stated activity of the reporting units. This happens due to the lack of updating of the Statistical Business Register, which is the basis for population selection. In order to update the Statistical Business Register, we submit all the information we receive in the course of conducting the survey, which are related to any organisational changes, to the Statistical Business Register.

2.2.8. Imputation rate

The indicator is not applicable.

2.2.9. Model assumption error

Not available.

2.3. Data revision

2.3.1. Data revision – policy

The users of statistical data are informed about revisions (provisional, final data) on the website of the Croatian Bureau of Statistics.

Revisions are done for correcting errors or major changes in classifications or in methodology.

Routine revisions are not carried out since all data are available according to deadlines.

Notices about minor changes are announced in First Releases at the time the change has been introduced.

The same data revision policy is applied both for national data and for data sent to Eurostat.

The data publishing revision policy of the Croatian Bureau of Statistics includes the following:

- 1) updating of the Calendar of Statistical Data Issues
- 2) Publishing corrections of the released data
- 1) Updating of the Calendar of Statistical Data Issues

The data publishing revision policy of the Croatian Bureau of Statistics, which is carried out according to the defined deadlines, is carried out by updating the Calendar of Statistical Data Issues. According to the Official Statistics Act, changes in publishing deadlines for publications/data are announced in advance. The Croatian Bureau of Statistics is obliged to announce each change in publishing deadlines (updating of the Calendar of Statistical Data Issues) at least three days prior to the date originally announced in the Calendar of Statistical Data Issues on their website.

The update of publishing deadlines for data or publications (update of the Calendar of Statistical Data Issues) is announced without delay on the website of the Croatian Bureau of Statistics by changing the date in the Calendar of Statistical Data Issues to the new one and putting a notice next to the Calendar of Statistical Data Issues, which says: “updated”, and specifying the accurate new date.

Therefore, the Calendar of Statistical Data Issues that contains the original publishing deadline for a particular publication/statistical data is replaced with the new Calendar of Statistical Data Issues, which includes the updated publishing deadline. The original Calendar of Statistical Data Issues is kept in the Publishing Department, which registers every change in publishing deadlines for publications in the Calendar of Statistical Data Issues update base.

- 2) Publishing corrections of the released data

In cases when an error is observed in the published data, the Croatian Bureau of Statistics publishes a correction as soon as possible and as simple as possible in order to help users to clearly see what has been changed in comparison to the originally published data. The correction is carried out by marking the incorrect data with an asterisk and creating the correction.

2.3.2. Data revision – practice

Major changes in the methodology and changes of the base year are published in the First Release at the time when the change has been introduced.

The general practice is to explain all changes in the methodology when the data based on the new methodology are published for the first time.

In 2015, a revision of data on construction work indices was carried out. The revision is comprised of an improved method for the calculation of construction works, which includes the adjustment of working hours with the productivity factor. The new method is applied to monthly and quarterly indices since 2000. Information on methodological changes are provided in the Notes on Methodology that are a part of all related paper or electronic publications.

Since the productivity factor is estimated on an annual basis on the basis of the data from the previous year, the data for the whole reference year are issued as provisional data. After the calculation of the actual productivity for the reference year is done, the final results are published. The average difference between the provisional and final data for 2021 is 0.19 percentage points.

Due to the replacement of estimated data with subsequently obtained data, routine revisions are not carried out since all data are available in accordance with deadlines.

However, if an error occurs, corrected data are published in the next issue of the First Release. Data changed in relation to the previously released ones are disseminated with a comment.

2.3.3. Data revision – average size

Data revision – average size is:

Statistic	Domain	Domain value	Comment	January	February	March	April	May	June	July	August	September	October	November	December	Average
Volume index of construction works	Croatia	Croatia		0,167	0,185	0,214	0,200	0,200	0,193	0,195	0,176	0,200	0,192	0,188	0,184	0,191

2.4. Seasonal adjustment

The seasonal and working-day adjustment were done by applying the "JDemetra+" programme interface (version 2.2.2.), using the X13 ARIMA method on the monthly index series (\emptyset 2015 = 100), which starts with the index for January 2000. The calculated series of the volume indices of construction works are comparable to those published by Eurostat.

The seasonal and working-day adjustment is not carried out for data on the value of orders.

3. Timeliness and punctuality

3.1. Timeliness

For national purposes, provisional monthly indicators are published T + 53 days after the end of the reporting month.

Provisional monthly indicators are sent to Eurostat in a given form (for construction in total, buildings and civil engineering works). The legal deadline is T + 60 days from the end of the reporting period.

Since the productivity factor is estimated on an annual basis on the basis of the data from the previous year, the data for the whole reference year are issued as provisional data. After the calculation of the actual productivity for the reference year is done, the final results are published. The final results for 2021 were published together with provisional data for January 2022 (three months after the end of the reporting year).

Forms are sent to the reporting units (which did not choose filling in electronic questionnaires) once (for the entire year), at the end of December. The deadline for answers is the 20th of the month for the previous month. Data collection was completed approximately 20 days after the response deadline.

3.1.1. Timeliness – first results

Time lag – first results is T + 53 days.

3.1.2. Timeliness – final results

Time lag – final results is T + 258 days.

3.2. Punctuality

All First Releases are published in accordance with the deadlines from the Calendar of Statistical Data Issues. There is no time lag between the actual data publishing date and the date announced in the Calendar of Statistical Data Issues.

3.2.1. Punctuality – delivery and publication

Punctuality is 1.

4. Accessibility and clarity

Volume indices of construction works are published in the following statistical publications: monthly First Releases, STS Database (the database of short-term statistics) at <https://stsbaza.dzs.hr/en/Report>, and in Excel tables on the website of the Croatian Bureau of Statistics under the link "Statistics in Line" (in Croatian and English).

Values of new orders are published in quarterly First Releases and in Excel tables on the website of the Croatian Bureau of Statistics under the link "Statistics in Line" (in Croatian and English).

These publications also contain short methodological explanations.

Publications are available to users in printed and electronic form on the website of the Croatian Bureau of Statistics <https://podaci.dzs.hr/hr/podaci/gradevinarstvo/>.

All publications are released simultaneously to all users at 11 a.m.

No one has advantage in accessing data.

4.1. News releases

Monthly data on the volume of construction works are published regularly in First Releases "Construction Works Indices", seven weeks after the end of the month.

Quarterly data on the value of orders are published regularly in First Releases "Completed Construction Works and Orders, Business Entities Employing 20 or More Persons", nine weeks after the end of the quarter.

The released data are available on the website of the Croatian Bureau of Statistics at <https://podaci.dzs.hr/hr/podaci/gradevinarstvo/>.

4.2. Online database

Monthly data on the volume of construction works (according to Eurostat's requirements - non-adjusted indices, seasonally adjusted indices, working-day adjusted indices, trend indices) are published in the STS databases (Short-Term Business Statistics Database) at <https://stsbaza.dzs.hr/en/Report>.

4.3. Micro-data access

The conditions under which certain users can access microdata are regulated by the Ordinance on the Conditions and Manner of Using Confidential Statistical Data for Scientific Purposes.

4.4. Documentation on methodology

Volume indices of construction works are published in the following statistical publications: monthly First Releases, STS Database (the database of short-term statistics) at <https://stsbaza.dzs.hr/en/Report> and in Excel tables on the website of the Croatian Bureau of Statistics under the link "Statistics in Line" (in Croatian and English).

New orders are published in quarterly First Releases and in Excel tables on the website of the Croatian Bureau of Statistics under the link "Statistics in Line" (in Croatian and English).

These publications also contain short methodological explanations.

Publications are available to users in printed and electronic form on the website of the Croatian Bureau of Statistics <https://podaci.dzs.hr/hr/podaci/gradevinarstvo/>.

National documents:

- a) Brief notes on methodology are available in monthly and annual publications on construction.
- b) Detailed notes on methodology are published in the Methodological Guidelines No 75 entitled Monthly and Quarterly Report on Construction (Revision), Croatian Bureau of Statistics, Zagreb, 2017. at [Microsoft Word - MU-75.doc \(dzs.hr\)](#).

International documents and manuals:

- a) European business statistics compilers' manual for short-term business statistics, Eurostat, 2021
- b) Commission implementing Regulation (EU) 2020/1197 of 30 July 2020 laying down technical specifications and arrangements pursuant to Regulation (EU) 2019/2152 of the European Parliament and of the Council on European business statistics repealing ten legal acts in the field of business statistics
- c) European business statistics methodological manual for compiling the monthly index of production in construction, Eurostat, 2021

5. Coherence and comparability

5.1. Asymmetry for mirror flows statistics

Not available.

5.2. Comparability over time

- 1) Data series on construction work indices are available since January 2000. Data series are comparable and have no breaks.

Revisions:

- a) The survey coverage was expanded in 2010, due to the inclusion of crafts and trades. Until 2010, data were collected only for legal entities employing 20 or more persons. Since January 2010, data for crafts and trades have been collected according to the same methodology. After a series of data was created based on three years of statistical observation, the data were evaluated, using a linear regression model, for the period when data for crafts and trades were not collected (from 2000 to 2009).

- b) In 2015, a revision of data on construction work indices was carried out. The revision is comprised of an improved method for the calculation of construction works, which includes the adjustment of working hours with the productivity factor. The new method has been applied to monthly and quarterly indices since 2000.
- 2) Data series on the value of orders are available since 2000. However, the data series are not comparable in the entire period due to the inclusion of crafts and trades in 2010. For the period from 2000 to 2009, no data evaluation was performed. The average share of crafts and trades in the total recorded data for three years is 2.2% in the value of orders.

5.2.1. Length of comparable time series

Length of comparable time series is:

Domain	Domain value	Comment	January	February	March	April	May	June	Jul	August	September	October	November	December
Croatia-Volume indeks of construction works	Croatia		253	254	255	256	257	258	259	260	261	262	263	264

5.2.2. Reasons for break in time series

Data series on indices of construction works are comparable and have no breaks. Data series on the value of orders are not comparable in the entire period due to the inclusion of crafts and trades in 2010. For the period from 2000 to 2009, no data evaluation was performed. The average share of crafts and trades in the total recorded data for three years for the value of orders is 2.2%.

5.3. Coherence – sub-annual and annual statistics

The indicator is not applicable.

5.4. Coherence – national accounts

Coherence – national accounts is:

Statistics	Domain	Domain value	Comment	Correlation coefficient
Correlation coefficient, 2001 – 2021	Croatia	Croatia	Correlation coefficients for annual rates based on working day-adjusted quarterly volume indices of construction works and value added for sector F – Construction in national accounts	0.83

5.5. Coherence – administrative sources

The indicator is not applicable.

5. Cost and burden

6.1. Cost

Total costs of the Croatian Bureau of Statistics amount to 8 850 hours per year.

6.2. Burden

Not available.
